Acknowledgements

The European Oncology Nursing Society (EONS) is deeply grateful to the many individuals who made the fifth edition of the EONS Cancer Nursing Education Framework possible. Special thanks are due to Virpi Sulosaari for her great leadership in this process. EONS would also like to give special thanks to all those who led and participated in previous updates.

EONS would like to thank the following individuals who contributed to the fifth edition:

Task group

Sulosaari Virpi, PhD, RN, Principal lecturer, Turku University of Applied Sciences, Finland. President Elect, European Oncology Nursing Society.

Drury Amanda, PhD, MSc, BSc, RGN, Associate Professor in General Nursing, School of Nursing, Psychotherapy, and Community Health, Dublin City University, Ireland. Research Working Group Co-Chair.

Gašpert Tihana, MSc, BSc, RN, Teaching Assistant in Nursing, Faculty for Health Studies Rijeka, Croatia. Clinic for Radiotherapy and Oncology, Clinical Hospital Center Rijeka. Young Cancer Nurse Network member.

Katsaragakis Stylianos, PhD, MSc, RN, Assistant Professor in Palliative Care. Nursing Department, National and Kapodistrian University of Athens, Greece. Communication Working Group member.

Khmaladze Ana, RN, Caucasus Medical Centre – Clinical Oncology Department, Georgia, Tbilisi. Young Cancer Nurse Network member.

McInally Wendy, PhD, MSc, BSc (Hons) Children and Young People’s Nursing, SFHEA. Senior Lecturer in Children and Young People’s Nursing, The Open University, United Kingdom. Education Working Group Co-Chair. EONS Executive Board member.

Nevin Mary, PhD, RGN, Assistant Professor, School of Nursing, Psychotherapy and Community Health, Dublin City University, Ireland. EONS Education Working Group member.

Taylor Vanessa, EdD, MSc, PGCE, RGN, Deputy Head of School (Nursing) (Students and Teaching), Professor of Learning, Teaching & Professional Practice (Cancer and Palliative Care), School of Nursing UCLan, United Kingdom. Education Working Group member.

Wyatt Debbie, MSc Nursing, RN, BSc (Hons) Health, DPSN, Cert Ed for Nurser Teachers, ENB237 Oncology Nursing Course. Senior Lecturer, Faculty of Health and Social Care, University of Chester, United Kingdom. Education Working Group member.

EONS also extends warmest thanks to Irena Rollo, EONS Project Officer for her support in the final stages of the update and Helen Oswald, EONS Communications Manager, for the proofing of the document.
We are extremely grateful to the EONS working group members and external reviewers who contributed valuable feedback and suggestions (in alphabetical order).

Fernández Ortega Paz, PhD, MSc, RN, Psych, Cap de Recerca Cures Infermeres. Nursing Research Head Nurse, Institut Català d'Oncologia, Spain.

Fowler Matt, RN, MSc. Consultant Advanced Clinical Practitioner for Oncology and Haematology, University Hospitals of Derby and Burton National Health Service Foundation Trust, United Kingdom.

Cloconi Constantina, PdD(c), MSc, RN, Research Nurse at German Oncology Centre, Germany and Teaching Assistant at Cyprus University of Technology, Cyprus.

De Munter Johan, RN, PgCert, cancer nurse manager, University Hospital Ghent, Belgium.

Fox Patricia, Lecturer/Assistant Professor, Programme Director of the Graduate Diploma in Cancer Nursing. Director of UCD SNMHS Continuing Professional Development (CPD) Programmes, University College Dublin, Ireland.

Lacerda Cristina, MSc, RN, Manager Nurse, Oncology Departement in Portuguese Oncology Institute Lisbon. Invited professor at the Portuguese Catholic University of Lisbon. Vice-President of AEOP, Portugal.

Pape Eva, PhD MSc RN, Clinical nurse specialist digestive oncology, Ghent University Hospital, Belgium.

Protogiros Dimitrios, RN, BSN, MSc, Ministry of Health General Secretary of Primary Health Care, Greece.

Sharp, Lena, RN, PhD, EONS Senior Advisor, Head of Department, Regional Cancer Centre Stockholm-Gotland, Sweden.

Semerci Remziye, PhD,RN Assistant Professor, Koç University, School of Nursing, Child Health and Disease Nursing, Turkey.

Van Klinken Merel, MSc, RN, oncology and palliative care nurse in Netherlands Cancer Institute Antoni van Leeuwenhoek, the Netherlands.

Verity Rebecca, PhD, Director of The Royal Marsden School. Honorary Professor, University of East Anglia, United Kingdom.

Tanay Mary, RN RNT BSc DipHE(Onc) MSc PGCE FHEA, NIHR Doctoral Research Fellow, Florence Nightingale Faculty of Nursing, Midwifery and Palliative Care, King’s College London, London, UK.

Titzer Harald BSc, MSc, RN, Head Nurse Division of Oncology at Department of Medicine I, General Hospital and Medical University of Vienna, Austria.
Foreword from the EONS Presidents

As Presidents of the European Oncology Nursing Society (EONS), we are very proud to present the updated EONS Cancer Nursing Education Framework 2022. The very first cancer nursing education document (EONS Post-basic Curriculum in Cancer Nursing) was developed by EONS in 1991 and was one of the first nursing initiatives to receive funding from the European Union’s Europe Against Cancer (EAC) programme. The document was then extensively revised in 1998 and 2013. In 2018, the framework was updated with major revisions of structure and to better reflect the progress and developments within cancer care and cancer nursing. The name was changed to “EONS Cancer Nursing Education Framework” to better capture the purpose of the document. The extensive developments within cancer care and increased body of evidence-based information available for cancer nursing practice were the driving forces of the updated 5th edition.

The focus of the update process was on the literature underpinning the Framework and education for cancer nurses. In view of the rapid development in cancer care, increasing number of systematic reviews and professional guidelines and standards, reading lists need to be seen as a starting point. Further literature searches are always recommended to ensure the contemporary content of the education. Also, any relevant national and other international policies should be integrated in the implementation of education.

The EONS Cancer Nursing Education Framework has proven to be a very useful document in many countries across Europe, with the previous version becoming the most downloaded document in EONS’ history. It has been used for a great many purposes, for example as a reference to advocate for more hours of training on certain topics, to promote the development of new national cancer nursing programmes and career possibilities, to support continuing education programmes and as guidance for other educational events. EONS members are advised to adapt this Framework to meet their specific professional needs within their country. To support the versatile use of the Framework, a short guide on “How to use” with examples is provided as Annex 1. The development of digital health and cancer care impacts cancer nursing practice and education. Therefore, it was seen as important to also address eHealth in this updated Framework (annex 2). While this topic is not addressed directly within each module, the principles of eHealth should be discussed within the context of educational topics in the modules as appropriate.

The latest revision was led by the EONS President Elect, whose background is in cancer nursing education, together with members of EONS Education Working Group and representatives from all the EONS working groups and the Young Cancer Nurses network. EONS’ member organisations, the European National Cancer Nursing Societies, have also been involved in the process together with other experts. For an overview of the update process, see Figure 1 below.

Johan de Munter
EONS President

Virpi Sulosaari
EONS President Elect
Figure 1: Process Overview

1. EONS Board decision to update the EONS Cancer Nursing Education Framework 2018
2. Task group of cancer nursing experts representing the four EONS working groups and YCN was formed September 2021
3. The task group identified the main revision needs, subgroups for module updates were made and templates to be used in the literature update.
4. Task group conducted review following a systematic process, extracted the data, and updated the modules and reading lists.
5. Task group review of the Framework
6. Online survey to obtain information regarding Framework usefulness and examples of how it has been used.
7. Further revisions based on the survey results
8. External review and feedback from all four EONS working groups, executive board, and invited international experts
9. Further revision based on received feedback by the task group
10. Presentation of the final Framework content to the National Societies at EONS Advisory Council and EONS15 conference (September 2022)
## Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced Practice Nurse</td>
<td>Registered nurse who has acquired the expert cancer nursing knowledge base, complex decision-making skills and clinical competencies for expanded practice, the characteristics of which are shaped by the context and/or country in which they are credentialed to practice. A master’s degree is recommended for entry level. (International Council of Nurses [ICN], 2020)</td>
</tr>
<tr>
<td>Cancer nurse</td>
<td>It is the position of the European Oncology Nursing Society that a cancer nurse is a qualified registered nurse who has the authority and full responsibility to provide essential nursing care to people affected by cancer. This care is based upon their evidence-based, specialised, ethical and personal knowledge and skills. Cancer nurses are fully accountable in all cancer care settings and across the care continuum for all nursing services and associated patient outcomes provided under their direction.</td>
</tr>
<tr>
<td>Cancer prevention</td>
<td>Cancer prevention can be divided into primary, secondary, and tertiary prevention. <em>Primary prevention</em> involves avoiding exposure to carcinogenic agents or behaviours and frequently is applied to broad populations, <em>secondary prevention</em> targets existing, more specific risks in more closely defined higher-risk populations and <em>tertiary prevention</em> primarily aims to prevent or control the symptoms and morbidity of established cancer, or the morbidity caused by cancer therapy. (Blackburn, 2010)</td>
</tr>
<tr>
<td>Cancer Care Continuum</td>
<td>A framework for understanding cancer-related pathway priorities for the people affected by cancer, from prevention to survivorship or end of life. The Framework places at its core the person with cancer, significant others and informal carers (person-centered care) and shows the need for communication between the patient and the health-care providers across hospital and community settings. (Young et al., 2020)</td>
</tr>
<tr>
<td>Informal carers</td>
<td>Usually relatives but sometimes friends, whom the patient identifies as providing significant usually unpaid support and care, and as ‘sharing the most’ in their illness experience. (National Cancer Institute [NCI], 2022)</td>
</tr>
<tr>
<td>Competencies</td>
<td>Competencies represent a dynamic combination of knowledge, understanding, skills and abilities. The knowledge, skills, values, and attitudes that are required for cancer nurses to carry out their work safely and effectively.</td>
</tr>
<tr>
<td>eHealth</td>
<td>The cost effective and secure use of information and communication technologies (ICT) in support of health and health-related fields, including healthcare services, health surveillance, health literature, and health education, knowledge and research. (WHO, 2010)</td>
</tr>
<tr>
<td>End of Life (EOL)</td>
<td>People in the last months or years of their life; this includes those whose death is imminent (expected within a few hours or days). (National Health Services [NHS], 2022)</td>
</tr>
<tr>
<td>End of Life Care (EOLC)</td>
<td>Holistic, comprehensive care which is provided to people who are nearing the end of life, including the necessary support to family members and significant others. Usually provided during the last year of life but this is often difficult to predict. The aim is to help people live as well as possible and to die with dignity. End-of-life care may be used synonymously with palliative care or hospice care and may also be understood more specifically as comprehensive care for dying patients in the last few hours or days of life.</td>
</tr>
<tr>
<td>Epidemiology</td>
<td>The study of the distribution of diseases and determinants of diseases in populations, including all forms of disease that relate to the environment and ways of life.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>European Credit Transfer System (ECTS)</td>
<td>European Credit Transfer System (ECTS) is a central tool in the Bologna Process. ECTS is a learner-centred for credit accumulation and transfer based on the principle of transparency of the learning, teaching and assessment processes. Its objective is to facilitate the planning, delivery and evaluation of study programmes and student mobility by recognising learning achievements, and qualifications and periods of learning. (European Commission, ECTS Users’ Guide, 2015)</td>
</tr>
<tr>
<td>Evidence-based Practice (EBP)</td>
<td>The conscientious, explicit and judicious use of best evidence in making decisions about the care of the individual patient. It means integrating individual clinical expertise with the best available external clinical evidence from systematic research. (Sackett et al., 2000)</td>
</tr>
<tr>
<td>Health literacy</td>
<td>Health literacy is an important predictor of successful self-management (Papadakos et al., 2018). It refers to people’s knowledge, motivation and competences to access, understand, appraise, and apply health information. That is, to make judgments and take decisions in everyday life concerning healthcare, disease prevention and health promotion to maintain or improve quality of life. (Sørensen et al., 2012)</td>
</tr>
<tr>
<td>Integrated cancer care</td>
<td>An integrated approach to cancer care, bridging cancer prevention, research, early-diagnosis, and treatment to improve patient outcomes. (European Society for Medical Oncology [ESMO], 2020)</td>
</tr>
<tr>
<td>Multidisciplinary team (MDT)</td>
<td>Teams consisting exclusively of professionals from different professions or disciplines. The terms inter/multi-disciplinary are broader and include all members of healthcare teams, professional and non-professional (Nancarrow et al., 2013). Multidisciplinary collaboration refers to collaborative practice of the team.</td>
</tr>
<tr>
<td>Nursing-sensitive outcomes</td>
<td>Outcomes which define the end results of nursing interventions and are indicators of problem resolution or progress toward problem or symptom resolution. The ICN defines a nursing outcome as the measure or status of a nursing diagnosis at points in time after a nursing intervention, while nursing-sensitive outcomes are defined as changes in health status upon which nursing care has had a direct influence. Variables affecting patient outcomes include: diagnosis, socio-economic factors, family support, age and gender, and the quality of care provided by other professionals and support workers. (ICN, 2009)</td>
</tr>
<tr>
<td>Nurse-led clinics/services</td>
<td>A nurse-led clinic is any outpatient clinic that is run or managed by registered nurses, usually nurse practitioners or clinical nurse specialists. Nurse-led services refers to services in which a nurse is responsible for the overall co-ordination, management and continuity of care for a specific episode of treatment or intervention. However, only some countries in Europe have introduced nurse-led clinics or services in the health service system.</td>
</tr>
<tr>
<td>Palliative care</td>
<td>An approach that improves the quality of life of patients and their families facing the problems associated with life-threatening illness through the prevention and relief of suffering by means of early identification and impeccable assessment and treatment of pain and other problems, physical, psychosocial and spiritual (WHO, 2002).</td>
</tr>
<tr>
<td>Patient-reported outcome (PRO)</td>
<td>The distinction between a PRO and an observer-generated report is that the PRO is a self-report made directly by the patient without being made through another party. PROs can be defined as a ‘measurement of any aspect of a patient’s health status that comes directly from the patient and include health-related quality of life (HRQOL), symptoms, satisfaction and adherence to medication. (US Food and Drug Administration, 2009; Calvert et al., 2013)</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Person affected by cancer</td>
<td>Person affected by cancer refers to people affected by all types of cancer, including those at risk of developing cancer, people living with cancer, cancer survivors, informal carers, family members and significant others across the age spectrum and continuum of care (Royal College of Nursing [RCN], 2022).</td>
</tr>
<tr>
<td>Person-centered care</td>
<td>Person-centered care is defined by the World Health Organization as empowering people to take charge of their own health rather than being passive recipients of services. It includes care approaches and practices that see the person as a whole with many levels of needs and goals, with these needs coming from their own personal social determinants of health. (World Health Organization [WHO], 2015)</td>
</tr>
<tr>
<td>People-centered care</td>
<td>People-centered care is an approach to care that consciously adopts individuals’, carers’, families’ and communities’ perspectives as participants in, and beneficiaries of, trusted health systems that respond to their needs and preferences in humane and holistic ways (World Health Organization [WHO], 2015).</td>
</tr>
<tr>
<td>Self-management</td>
<td>A dynamic, self-empowering, self-directed process of implementing behaviours that recognise, prevent, relieve or decrease the timing, intensity, distress, concurrence, and unpleasant quality of symptoms to achieve optimal performance outcomes. Self-management is thought to be broader than self-care as it addresses the management of treatments, lifestyle changes and physical, psychosocial, and spiritual consequences of disease. Positive changes in self-management behaviour leads to the achievement of optimal performance outcomes such as functional status. (Baydoun et al., 2018)</td>
</tr>
<tr>
<td>Supportive care</td>
<td>The prevention and management of the adverse effects of cancer and its treatment for people with cancer. This includes management of physical and psychological symptoms and side effects across the continuum of the cancer experience from diagnosis, through anticancer treatment, to post-treatment care. Enhancing rehabilitation, secondary cancer prevention, survivorship and end-of-life care are all integral to supportive care (Multinational Association of Supportive Care in Cancer [MASCC, 2015]). Supportive care is the central pillar of cancer nursing. It enables and empowers people to self-manage where possible. (Young et al., 2020)</td>
</tr>
<tr>
<td>Survivorship</td>
<td>Survivorship focuses on the health and well-being of people living with and beyond cancer. This includes the physical, mental, emotional, social, and financial effects of cancer that begin at diagnosis and continue through treatment and beyond. The survivorship experience also includes issues related to follow-up care (including regular health and wellness checkups), late effects of treatment, cancer recurrence, second cancers, and quality of life. Cancer survivors are individuals from the time of diagnosis, through the balance of their life. Family members, friends, and informal caregivers are also considered part of the survivorship experience. (NCI’s definition, Denlinger et al., 2014)</td>
</tr>
<tr>
<td>Symptom management</td>
<td>Care given to help relieve the symptoms of a disease, such as cancer, and the side effects caused by treatment of the disease. Symptom management may help a person feel more comfortable, but it does not treat or cure the disease. It may involve taking certain medicines to relieve pain or nausea or using guided imagery or deep breathing exercises to reduce stress or anxiety. Symptom management is one aspect of palliative care and supportive care. (NCI’s dictionary)</td>
</tr>

</table>
REFERENCES AND RESOURCES

Royal College of Nursing (RCN), 2022. Career and education framework for cancer nursing. RCN, London, UK.

Introduction

The overall purpose of this EONS Cancer Nursing Education Framework is to provide guidance regarding the fundamental knowledge, skills and competencies required by nurses who care for people affected by cancer as part of multi-professional teams across Europe. It is particularly intended to provide guidance for structuring the learning content of cancer nursing programmes and continuing professional education and to those involved in the education, training and professional development of cancer nurses across Europe.

Cancer nurses are at the heart of tackling the increasing burden of cancer (Young et al., 2020). Nurses who receive specialist education in cancer care at postgraduate level have the potential to have impact across the spectrum of cancer care (Yates et al., 2021). EONS’ mission is to ensure that all people affected by cancer benefit from the care of highly educated, well-informed and competent cancer nurses. Person-centered integrated cancer care and optimal communication are essential components of cancer nursing care which can be achieved by investment in high-quality cancer nursing education. (Young et al. 2020).

Education preparation of cancer nurses in Europe

When using the EONS Cancer Nursing Education Framework, it is necessary to note variations between countries across the European continent. These are due to differences in education systems, but also the state of recognition of cancer nursing as a specialty and nursing roles in general. Thus, the government and non-government organisations should optimise the substantial resource of nurses to ensure that the burden of cancer is reduced worldwide (Yates et al., 2021). Contextual factors such as recognition, autonomy, access to graduate education, career opportunities, and educational preparation both in the length of and level of education are one of the described differences (Sharp et al., 2019; Kelly et al., 2020). Some countries have established postgraduate certified cancer nursing programmes, while others have invested in postgraduate cancer nursing programmes without certification while in some countries, no specialised cancer nursing programmes exists.

EONS’ position is that a cancer nurse is a qualified registered nurse who has the authority and full responsibility to provide essential nursing care to people affected by cancer. This care is based upon their evidence-based, specialised, ethical and personal knowledge and skills. Cancer nurses are fully accountable in all settings where people with cancer are cared for and across the cancer care continuum for all nursing services and associated patient outcomes provided under their direction.

There are three levels of cancer nursing expertise: 1) generalist, 2) specialist, and 3) advanced. All registered nurses should have fundamental preparation on the prevention of cancer and the care of people affected by cancer. The specialised nurses who have completed postgraduate education relevant for cancer care and have developed more specialised competencies, are able to provide more holistic and comprehensive care for people affected by cancer. These specialist cancer nurses offer tailored, accessible and expert care to people living with, through and beyond cancer and to their families, informal caregivers and significant others in all phases of the Cancer Care Continuum, from primary prevention to end of life care. An advanced level cancer nurse is a nurse with post-graduate education and training in advanced nursing (see ICN 2020). The third level is discussed in the chapter on Advanced Cancer Nursing Roles.
Care across the lifespan and vulnerable groups

Cancer affects all population groups. The ‘care across the lifespan’ approach in healthcare reflects on, and adapts to, changes in demographics, society and the expectations of individuals, society and the expectations of individuals. A lifespan perspective recognises that changes in physical, cognitive and social domains are all influential in cancer nursing practice. Nurses interact with people at every point of their lifespan. It should be noted that the goal of this framework is to provide a general overview and at the same time cancer-nursing-specific learning content without aiming to capture the needs of specific groups. Cancer nurses caring for people of different ages affected by cancer require specific competencies in clinical practice for example, paediatric or gero-oncology nursing. It is also recognised that people with different types of cancer have specific needs that call for distinct competence requirements in cancer nurses. In this Framework, it is not possible to capture all the needs of specific vulnerable groups of people with cancer: people who are disadvantaged for a variety of reasons such as those with intellectual disability, mental illness, mental health problems, social deprivation, prisoners, homeless people, people with auditory or visual impairment, LGBTQIA+, refugees and migrants. There is also inequality and disparities among people from different genders, geographical locations and ethnicities.

Therefore, the users of the EONS Cancer Nursing Education Framework are encouraged to always critically review and extend the suggested reading of the modules to capture the essence of education provided depending on the target group, learning goals and specific competence requirements.

Healthcare is also rapidly shifting towards a digitised future where technological solutions are used in the care of people with cancer across the care continuum and settings (Charalambous 2020). eHealth technology, correctly used, can be a very useful complementary tool to facilitate dialogue among health care professionals and meet the health and care needs of people affected by cancer. Digital health and learning reflect not only on cancer care but on cancer education too. Digital health is an integral part of all the Framework modules. However, to acknowledge the development digitalisation, an additional section on ‘eHealth and Cancer’ is available in Annex 1.

The structure and use of the EONS Cancer Nursing Education Framework

The EONS Cancer Nursing Education Framework comprises eight modules which can be used in their entirety (equivalent to 54 ECTS), or individually, to support the planning and implementation of education (Figure 2). The Framework can be adapted to support the development of specialist education for nurses according to country-specific needs and regulation. Thus, EONS believe that following the outline of this Framework will ensure the educational preparation of specialist cancer nurses. Competencies and learning goals of advanced level cancer nursing education are not the focus of the Framework. We also recognise that there are different ways to support access for nurses to continuing professional education and ensure the competences of the cancer care workforce. The Framework can be used to identify goals and plan professional development of individual nurses or a unit. To support the use of the Framework, a short guide has been developed (available in Annex 2).

Reflecting the overall Cancer Care Continuum (Young et al., 2020), the first five modules of the Framework focus on the key knowledge that cancer nurses require across the spectrum from cancer prevention to end-of-life care. The last three modules address communication, leadership and management and research; however, given their critical importance in the context of cancer care, it is
recommended that these concepts are incorporated across all modules. In the 5th edition, we have edited the figure to capture the four cornerstones which encompass each of the modules: Care across lifespan, Person-centered Care, Patient and occupational safety and eHealth.

**Figure 2: Overview of the Framework**

Learning outcomes (what the learner should know) and their relevant practice competencies are described for each of the eight modules. The learning outcomes seek to address a variety of cognitive levels to encourage more complex learning, such as evaluation rather than the demonstration of knowledge and comprehension only. The content section is intended to provide guidance regarding the key concepts that need to be addressed in the respective modules to enable ‘the learner’ to achieve the learning outcomes and practice competencies for each. At the end of each module, a list of updated, relevant and seminal references and resources are provided. Given the rapid developments in oncology, increasing number of publications and available systematic reviews, professional guidelines and standards, reference lists need to be seen as a starting point. A further literature search is always recommended to ensure the educational content is up to date. In addition, any relevant national and other international policies should be integrated in the implementation of the education.

The Framework employs the ECTS in its attempt to identify the workload associated with each of the modules and their explicit learning outcomes (ECTS users’ guide 2015).
A total of 54 ECTS credits are allocated to the learning outcomes and associated workload of a full-time academic year or its equivalent. On completion of all eight modules, it is recommended that learners be encouraged to undertake a self-directed piece of work. Learners, therefore, could obtain a further six ECTS through undertaking a substantial piece of written work, e.g., a portfolio of evidence of learning and competence development combined with critical reflection (total of 60 ECTS). This document should aim to demonstrate overall learning from the programme of study.

This Framework aims to demonstrate overall learning in a postgraduate cancer nursing programme. Learning includes recommended contact hours and study hours with practice (in the learner’s own practice). Thus, EONS can only provide a recommendation; the actual education provider is responsible for making the decision and how the achievement of learning outcomes will be assessed once the education has been completed.

The methods used for learning, teaching and assessment and also the resources available for teaching and assessment will vary between countries. Examples of these are given in Table 1. It is recommended, where possible, that educators employ several different teaching and assessment strategies across all the modules to facilitate different learning styles. This is to provide learners with opportunities to play to their strengths and to learn from feedback provided during formative assessments.

Module 1

Cancer Prevention, Screening, Early Detection and Health Promotion in Cancer Care

Suggested ECTS credit points: 6
Contact hours: 60 hours
Study hours with practice: 120 hours (applying in their own practice)

MODULE OVERVIEW

The overall aim of this module is for the learner to develop knowledge and skills regarding cancer epidemiology with a view to enabling him/her to play a central role in the context of cancer prevention, screening and the early detection of cancer.

Cancer is a major cause of morbidity and mortality globally. As people are living longer, cancer incidence and mortality are expected to continue to increase because of the strong relationship between cancer and advancing age. Epidemiology plays a pivotal role in cancer risk reduction and control by describing the distribution of cancer and discovering risk factors for the disease. Estimations suggest that approximately 40% of the cancers in Europe could be prevented if current evidence related to risk and protective factors was translated into effective primary prevention activities (EU Beating Cancer Plan, 2021).

This module introduces the learner to key concepts which have shaped the development of cancer preventive, screening and early detection services at national and international levels. More specifically, it focuses on the epidemiology of cancer with respect to the occurrence, distribution, and determinants of cancer. Cancer prevention strategies, cancer screening and early detection are also addressed.

Module 2

Cancer Pathophysiology and the Principles of Treatment Decision-Making

Suggested ECTS credit points: 6
Contact hours: 60 hours
Study hours with practice: 120 hours (applying in their own practice)

MODULE OVERVIEW

The overall aim of this module is for the learner to develop knowledge and skills regarding cancer biology and the diagnosis and staging of cancer with a view to enabling them to support and facilitate the decision-making of people affected by cancer in the context of localised, locally advanced or metastatic disease.

This module focuses on the biological processes that contribute to the development of cancer. It also addresses the diagnostic and staging process and the principles of cancer treatment decision-making. The pathophysiology of cancer is important not only for understanding the process of cancer development but also to enhance knowledge of the rationale for the treatments. The role of the nurse within the multidisciplinary team regarding supporting people affected by cancer throughout the process is especially important here.

Module 3
Cancer Treatment, Patient and Occupational Safety

**Suggested ECTS credit points:** 9  
**Contact hours:** 90 hours  
**Study hours with practice:** 180 hours (applying in their own practice)

**MODULE OVERVIEW**

The overall aim of this module is for the learner to develop knowledge and skills to safely deliver cancer therapies used to treat cancer and manage the impact of the treatments on people with cancer.

Cancer nurses play a pivotal role within the multidisciplinary team on the safe delivery and management of therapies used to treat cancer. An important aspect of the nursing role in this context is to appropriately assess and manage treatment-related adverse effects and toxicities. Cancer nurses must also provide relevant and timely information to ensure that people with cancer can engage in clinical decision-making about their treatment, care and management to enable informed consent, and to understand their treatment and its potential side effects in order to increase self-management. Cancer nurses, therefore, require knowledge about the principles, mechanisms and impact of cancer treatments. Within this module the core skills underpinning the provision of safe practice within cancer healthcare settings will also be addressed.

Module 4
Supporting People Living With, Through and Beyond Cancer

Suggested ECTS credit points: 9
Contact hours: 90 hours
Study hours with practice: 180 hours (applying in their own practice)

MODULE OVERVIEW
The overall aim of this module is for the learner to develop the knowledge and skills to provide care and support to people affected by cancer throughout their care continuum. Advances in cancer screening programmes and treatment modalities result in an increase in long-term survivorship. However, this means that cancer survivors are more likely to experience longer-term physical and psychosocial effects which may persist for years beyond diagnosis. Cancer nurses have a pivotal role in the provision of excellent supportive care to people affected by cancer covering all phases of disease. While in this module it is acknowledged that palliative care should be introduced early in the disease trajectory and be delivered alongside potentially curative treatments, issues related to advanced disease and end of life will be addressed in the next module (Module 5)

Module 5
Supporting People with Advanced Disease and at End of Life

Suggested ECTS credit points: 6
Contact hours: 60 hours
Study hours with practice: 120 hours (applying in their own practice)

MODULE OVERVIEW

The overall aim of this module is to help learners develop knowledge and skills to deliver a high standard of palliative and supportive care to those who are living with advanced disease including at the end of life.

People living with advanced cancer can experience multiple and complex physical, practical, psychosocial, emotional and spiritual needs. Cancer nurses have a pivotal role not only in ensuring that people live well until they die but also in providing the conditions for experiencing a dignified death in accordance with their wishes.

As specified by the World Health Organisation, palliative care should be introduced to the person with cancer and their families early in the disease trajectory (not just at end of life) and delivered alongside treatments which aim to prolong life, such as chemotherapy and radiotherapy (WHO, 2020). However, it is recognised that within cancer healthcare services, where care may be focused on a curative approach, there are challenges and barriers to incorporating a palliative care approach.

Therefore, this module should aim to offer the learner practical strategies on how to apply and integrate the palliative approach when they care for people affected by cancer.

Module 6
Communication in Cancer Care

Suggested ECTS credit points: 6
Contact hours: 60 hours
Study hours with practice: 120 hours (applying in their own practice)

MODULE OVERVIEW

The overall aim of this module is to help learners to develop the knowledge and skills required for effective communication with people affected by cancer and the MDT throughout the Cancer Care Continuum from primary cancer prevention, early detection, throughout treatment and through to end-of-life care.

Effective person-centered communication is consistently identified as being a key factor in determining the cancer needs, concerns and preferences of people affected by cancer but also their satisfaction, adherence to treatment, recommended behaviour change, safety, improved outcomes and recovery.

Nurses working in all types of cancer care settings can be exposed to very difficult and distressing situations, some of which can be extremely challenging. Insufficient educational preparation and training in communication has been found to be a major factor contributing to stress, lack of job satisfaction and emotional burnout in healthcare professionals.
<table>
<thead>
<tr>
<th>LEARNING OUTCOMES</th>

Module 7
Leadership and Management in Cancer Nursing

Suggested ECTS credit points: 6
Contact hours: 60 hours
Study hours with practice: 120 hours (applying in their own practice)

MODULE OVERVIEW

The overall aim of this module is for learners to develop leadership skills to facilitate team management and to organise work and practice development within a cancer setting.

Regardless of role or position, all cancer nurses are expected to provide leadership. Multidisciplinary team working is vital in cancer care. Therefore, cancer nurses need to develop skills in interpersonal relationships, communication and workforce development.

Module 8
Research Utilisation and Evidence in Cancer Care

Suggested ECTS credit points: 6
Contact hours: 60 hours
Study hours with practice: 120 hours (applying in their own practice)

MODULE OVERVIEW

The overall aim of this module is for the learner to develop necessary knowledge and skills to enhance research utilisation and the provision of evidence-based care. Cancer nurses play a central role in the development and implementation of evidence-based practice. An understanding of the research process and the different research methodologies (including clinical trials) is necessary to facilitate research utilisation, initiate quality assurance processes and the implementation of evidence-based care. This module aims to develop the skills of the learner regarding searching, retrieving and critically appraising research for cancer care in cancer nursing.

1. Critically analyse how knowledge and evidence are developed for clinical practice.
   - Discuss the relevance and application of research methodologies to support the development of evidence to guide cancer nursing practice.
   - Demonstrates ability to provide an evidence-based rationale for interventions in cancer care in general and in cancer nursing in particular.
   - Identify the strengths and limitations of the different research methodologies employed.
   - Demonstrates capacity to develop and implement evidence-based interventions.
   - Data management and privacy in health services research.
   - Ethical issues in research and evidence-based change.
   - Introduction to research methodologies and levels of evidence to inform practice.
   - Involvement of patients and key stakeholders in co-design of interventions.
   - Overview of research designs, including quantitative, qualitative and mixed methods designs, and their strengths and limitations.
   - Reporting and presenting results of research and reporting standards for various research methodologies.
   - Research utilisation in nursing; barriers to and facilitators of research utilisation.
   - Use of specialist knowledge to contribute to the development of evidence-based policies and procedures and practice development for cancer nursing.

2. Identify the key sources of research and evidence-based clinical practice guidelines (CPGs) relevant to cancer care and cancer nursing.
   - Discuss characteristics of high-quality evidence relevant to cancer care and cancer nursing.
   - Effective search strategies, information skills tutorials.
   - Introduction to evidence synthesis.
   - Overview of electronic databases (e.g., PubMed, CINAHL Plus, Embase, PsycINFO, Cochrane library); print/e-journals and print/e-books.
   - Sources of grey literature, including relevant websites for clinical practice guidelines and evidence-based resources.
<table>

Advanced Cancer Nursing Roles

One of EONS’ most important strategic aims is to gain recognition for cancer nursing as a specialty all over Europe. The EONS Cancer Nursing Education Framework provides nurses, nursing educators, instructors, nursing managers, healthcare organisations and governments with guidance on educational preparation of nurses who care for people affected by cancer whatever their level of practice. It is crucial to recognise that it is important for nurses to have opportunities for continuous professional development and to build upon the knowledge and skills outlined in the Framework. This chapter discusses advanced practice nursing, which is the third level of cancer nursing as mentioned in the introduction to the Framework. An advanced level cancer nurse is a nurse with post-graduate education (master’s degree) and training in advanced nursing (see ICN 2020).

Research shows that higher nursing education is associated with improved patient outcomes and safety (Aiken et al, 2014; 2021) and that advanced nursing roles are safe, effective and well received by patients (ICN, 2017). In the WHO (2020) report, a total of 78 countries (53% of respondent countries) reported having advanced practice roles for nurses in healthcare. This WHO (2020) report recommends that planners and regulators should optimise the contributions of nursing practice, including advanced practice further accompanied by the WHO Global Strategic Directions for Nursing and Midwifery 2021-2025, stating that nurses with an advanced education can take extended responsibilities in the health system.

The need for advanced practice nursing roles, particularly in the field of cancer survivorship, is growing (Corcoran et al., 2015). However, advanced practice is equally needed across all spheres of the Cancer Care Continuum. Advanced practice nurses can bring added value on patient outcomes (Aiken et al., 2021, Kerr et al., 2021), job satisfaction, retention of nurse workforce and might be able to relieve the burden on oncology departments by reducing the number of visits through more efficient symptom management (Alotaibi & Al Anizi 2020). Furthermore, the nurse-led clinics have shown a positive impact on improving self-reported responses such as distress levels, satisfaction, quality of life, depressive symptoms, concerns and vomiting among people with cancer (Molassiotis et al., 2020). However, the regulations, recognition and requirements for advanced nursing roles vary across Europe (Maier et al., 2017).

In 2020, the International Council of Nurses (ICN) defined advanced practice nursing as advanced nursing interventions that influence clinical healthcare outcomes for individuals, families and diverse populations. Advanced practice nursing is based on graduate education and preparation along with the specification of central criteria and core competencies for practice. An advanced practice nurse (APN) is a generalist or specialised nurse who has acquired, through post-graduate education, the expert knowledge base, complex decision-making skills and clinical competencies for advanced nursing practice. The characteristics of the work role is shaped by the context in which they are credentialed to practice. The two most identified APN roles are clinical nurse specialist (CNS) and nurse practitioner (NP) (ICN, 2020).

ICN also describe the nature of practice for the APN roles (ICN, 2017; 2020). Practice is characterised by the integration and application of a broad range of theoretical and evidence-based knowledge i.e. integrates research, education, practice and management; a high degree of professional autonomy and independent practice; case management/own caseload; advanced health assessment skills, decision-making skills; diagnostic reasoning skills; recognised advanced clinical competencies; provision of consultant services to other health providers; plans, implements and evaluates programmes and recognised as first point of contact for patients. There are regulatory
mechanisms that are country-specific. Among these regulations are the right to diagnose, authority to prescribe medication, authority to prescribe treatment, authority to refer patients to other healthcare specialists and authority to admit patients to the hospital and other healthcare facilities.

Existing advanced cancer nursing roles vary considerably across Europe at present. For example, cancer nurses in the UK, Netherlands and Ireland may have roles as clinical nurse specialists (CNS), nurse practitioners (NP) or advanced nurse practitioners (ANP) with very wide-ranging tasks (described below). In most cases, a master’s degree or higher academic title is required for these roles. Other countries have specific roles in cancer care that are established but not formally recognised as advanced cancer nursing roles. This might create a risk of losing many highly qualified nurses in clinical practice (Lagerlund et al., 2015). Thus, as there is great variation in the educational preparation of APNs across Europe, it would be valuable to develop future programmes and APN roles with a more coherent approach. The ICN (2020) guidelines state that educational preparation of APNs through advanced practice nursing programmes should be via completion of a full master’s degree rather than individual master’s-level modules. ICN also recommends formal recognition of educational programmes, accreditation and a formal system of licensing, registration and certification.

Cancer nurses who develop their level of practice, in advanced nursing roles, can continue to develop their competencies and are often clinical role models, mentors, leaders, and supervisors and able to influence practice and policy. They could, therefore, have a positive impact on quality of care, retention of nurse workforce, recruitment and other important factors in healthcare. It is important to offer clinical nursing positions which require higher academic qualifications that could be combined with development and research, to enable cancer nurses to work to their full potential and to guarantee access to advanced cancer nursing care for people affected by cancer.

REFERENCES AND RESOURCES

Annex 1 How to use the framework

The EONS Cancer Nursing Education Framework (CNEF) aims to provide an informative and user-friendly document which has a wide range of uses, for example as a reference to advocate for more hours of training on certain topics, to promote development of new national cancer nursing programmes and career possibilities, to support a range of continuing education programmes and as guidance for other educational events. It can be used in its entirety or on a modular basis and can be adapted to suit the professional development needs of the individual or organisation.

This annex offers examples of how the framework may be used to support cancer nursing education and practice.

What is the EONS Cancer Nursing Education Framework?
The EONS CNEF provides a gold standard for education in cancer care which can be applied in any care setting. It consists of eight modules:

Module 1: Cancer Prevention, Screening, Early Detection and Health Promotion in Cancer Care
Module 2: Cancer Pathophysiology and the Principles of Treatment Decision-Making
Module 3: Cancer Treatment, Patient and Occupational Safety
Module 4: Supporting People Living With, Through and Beyond Cancer
Module 5: Supporting People with Advanced Disease and at End of Life
Module 6: Communication in Cancer Care
Module 7: Leadership and Management in Cancer Nursing
Module 8: Research Utilisation and Evidence in Cancer Care

The eight modules together encompass fundamental concepts in cancer and cancer care and provide an evidence-based resource which links theory and practice. Each module provides helpful references, suggested databases and websites which can be used to support a wider search by users who are planning additional specific and targeted learning (e.g., site specific cancers, cancer across the age spectrum).

Who can use this Framework?
The Framework is suitable for use by a wide range of stakeholders in any setting and at any level such as individual nurses, teams of nurses, nurse managers, nurse leaders and educators.
How can the Framework be used?

The overall Framework provides a structured guide to key concepts in cancer care which can be applied in any practice or education setting and at any level. Individual modules or the entire Framework can be used as a basis to inform learning and/or its development and can be adapted to suit the needs of the user. For example, users can further the content when planning cancer education which has a specific focus such as children and young people, geriatric oncology, site-specific cancers, people with additional and/or diverse needs or those who may be vulnerable.

Here are some examples of how the Framework can be used to support learning:

• Developing academic courses such as modules or programmes
  o Provides structure and content when planning and developing the education
  o Provides support in developing/strengthening aims and objectives for education
  o Provides guidance for developing assessment structures
  o Provides guidance for evaluating achievement of learning outcomes by students
  o Provides a suggested guide to academic ECTS points
• Developing sessions or study days
  o Provides structure and content when planning and developing the event
  o Provides support in developing/strengthening aims and objectives of the event
• Informing best practice
  o Guides the development and achievement of competencies in practice
• Personal and professional development
  o Self-reflective assessment of oncology nursing competencies and need for professional development
• EONS Endorsement
  o Guides application for endorsement of education events/courses by mapping to part of or whole of, the Framework (see link to EONS endorsement process https://cancernurse.eu/education/eons- endorsement/)
• Frameworks
  o Forms a basis for the development of national education and career development frameworks
• As a policy tool
  o Informs local and national policy.

Where

Individual modules or the Framework in its entirety can inform the basis of learning in any education or practice setting.

When

There are no restrictions on when the Framework can be used. However, the Framework is the intellectual property of EONS and when used, this should be acknowledged.
Annex 2 eHealth and Cancer

Introduction

Cancer nursing practice is influenced by the wider context of healthcare both nationally and globally, and this in turn influences the development and delivery of cancer education. The Covid-19 pandemic has shown the potential of digitalisation to transform the way that healthcare is delivered (Penedo et al., 2020). eHealth technology, correctly used, can be a very useful complementary tool to facilitate dialogue among healthcare professionals and meet the health and care needs of people affected by cancer. The EU Beating Cancer Plan also highlights the need to advance digital health services and the development and implementation of telehealth, eHealth applications and digital tools in cancer care. This annex highlights the relevance of digital health and learning to cancer care and cancer education and supports the application of digital health within the European Oncology Nursing Society Cancer Nursing Education Framework.

Context

Healthcare is rapidly shifting towards a digitised future where technological solutions are used in the care of people with cancer across the care continuum and settings (Charalambous, 2020). Person-centered cancer care needs to respond to increasing use of eHealth moving care beyond the traditional in-person care model to real-time, dynamic, and technology-assisted assessments and interventions (Penedo et al., 2020). The management of long-term conditions needs to be patient-centred, personalised, supporting people with cancer in different settings and enabled by digital health, data analytics, behavioural science and connected medical devices (Charalambous, 2020). Special attention needs to be taken when implementing telehealth to ensure equity of access for people with cancer, their safety and their engagement; it should complement and not be a substitute for in-person care. Also, appropriate training opportunities for healthcare professionals and expert guidance on the best use of telehealth in cancer care settings is crucial (European Cancer Organisation [ECO], 2021).

Main concepts related to eHealth – a definition of terms

- **eHealth**
  - The cost-effective and secure use of information and communication technologies (ICT) in support of health and health-related fields, including healthcare services, health surveillance, health literature, and health education, knowledge and research (WHO, 2010).

- **mHealth**
  - mHealth is a component of eHealth. It refers to medical and public health practice supported by mobile devices, such as mobile phones, patient monitoring devices, personal digital assistants (PDAs) and other wireless devices (WHO, 2011).

- **Information and Communication Technology (ICT)**
  - Is a “diverse set of technological tools and resources used to transmit, store, create, share or exchange information (UNESCO, 2009).

- **Telemedicine**
  - The delivery of a wide array of healthcare services by all healthcare professionals, where distance is a critical factor, using information and communication technologies for the exchange of valid information for diagnosis, treatment and prevention of disease and injuries, research and evaluation, and for the continuing education of healthcare providers, all in the interests of advancing the health of individuals and their communities. Often used to refer to care and services delivered by physicians (WHO, 1998).

- **Telehealth**
  - Often used interchangeably with telemedicine, however telehealth refers more to healthcare services involving all health care professions.
  - Involves the use of telecommunications and virtual technology to deliver healthcare outside of traditional healthcare facilities.
  - Allows for healthcare workers in remote field settings to obtain guidance from professionals elsewhere in relation to diagnosis, care and referral of patients (WHO, 2010).
Can also be defined as the use of electronic information and telecommunications technologies to support long-distance clinical healthcare, patient and health professional health-related education, public health and health administration, thus referring to both clinical and non-clinical applications in the way of education, administration and research, while telemedicine is often reserved for direct clinical and patient care applications.

- Digital Health
  - The field of knowledge and practice associated with the development and use of digital technologies to improve health. It encompasses eHealth and expands the concept of eHealth to include digital consumers, with a wider range of smart and connected devices. It also encompasses other uses of digital technologies for health such as the Internet of Things, advanced computing, big data analytics, artificial intelligence including machine learning and robotics (WHO, 2021).

**Benefits of eHealth**

Although the adoption of telehealth technology relies on patient participation and the motivation of patients to become partners in their healthcare (Pennell et al., 2017), eHealth has the potential to better the delivery of cancer care through improved patient–provider communication, enhanced symptom and toxicity assessment and management, and optimised patient engagement across the Cancer Care Continuum (Penedo et al., 2020). Examples of successful applications in cancer care include cancer telegenetics, remote chemotherapy supervision, administration and remote monitoring of oncology medication, symptom management, survivorship care, palliative care, and approaches to increase access to cancer clinical trials (Sirintrapun & Lopez, 2018, Maguire et al., 2021).

In the last decade and increasingly during the Covid-19 pandemic, telehealth, mobile applications and wearable devices have been dramatically changing access to health resources for patients, informal caregivers, and health care providers (Kessel et al. 2016). There are many current applications and software using information and communication technology in telehealth and mobile health in the oncology setting. Cancer nurses should be aware of the pervasiveness and impact of telehealth and mobile health to this unique population (Cannon, 2018).

**The benefits of telehealth for people with cancer include:**
- close and continual connection to the multidisciplinary team responsible for their care as well as efficient communication channels (e.g. Maguire et al, 2021)
- time-sensitive connection without compromising quality of care (Kessel et al., 2016)
- improved access to specialised cancer care services (e.g. for people with cancer who have difficulty traveling to a clinic because of living in a remote location or lack of transportation, increasing opportunities exist to access healthcare remotely (Doyle-Lindrud, 2016).

**The benefits of telehealth for the multidisciplinary team include:**
- opportunities to track and monitor the care across the cancer care continuum (Kraschnewski & Gabbay, 2013)
- timely reaction to care needs and early detections of complications
- channels for interprofessional communication, information sharing and clinical decision support (Doyle-Lindrud, 2016).
- the potential to reduce administrative burdens and improve both efficiency and quality of care delivery (Pennell et al., 2017).
- opportunities to better collaboration between primary and specialist care (ECO, 2021).

For telehealth to meet its full potential, updated policies, regulations, and clinical practice guidelines are needed to recognise advances in the new technologies while maintaining rigorous quality of care standards (Doyle-Lindrud, 2016). Nurses also need new and renewed skills to provide safe, effective, culturally relevant telehealth and virtual care (Rambur et al., 2019).
Why we need eHealth in cancer nursing practice?

eHealth interventions are increasingly being used in cancer care, for example to support patients and informal caregivers in managing symptoms and problems in daily life (Slev et al., 2016). eHealth, and telehealth as a means to deliver health care services, aim to improve the patient experience of care, improve the health of populations, reduce the per capita cost of health care and improve the experience of providing care (Tuckson et al., 2017). Telehealth shifts care to more participatory care and an improved healthcare system composed of patient empowerment (Pennell et al., 2017). For cancer nurses, people-centred approaches aiming for patient empowerment have become a strong point of reference and a necessity in cancer care, with patient and multidisciplinary communication a key component of relationship-based care for people affected by cancer and also for effective multidisciplinary teamwork (Young et al., 2020). As such, the relevance of eHealth to cancer care should be a key consideration when developing and delivering cancer education.
